

BEVEL GEAR UNITS
ZZ-SERVOLINE®

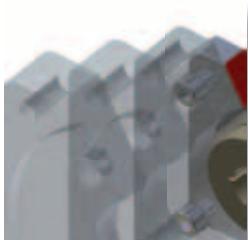

Gear Ratios

- $i = 3:1$
- $i = 4:1$
- $i = 5:1$
- $i = 6:1$
- $i = 8:1$
- $i = 10:1$
- $i = 12:1$
- $i = 15:1$

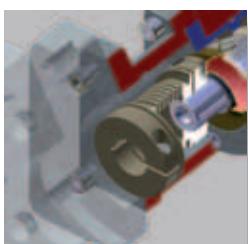

Spiral Bevel Gear

- KLINGELNBERG tooth system
- Hypoid Cyclo-Palloid
- High running quality
- Torsional backlash depending on design up to < 2 arcmin

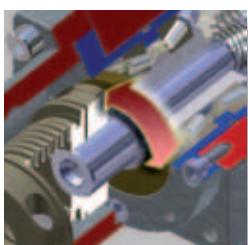

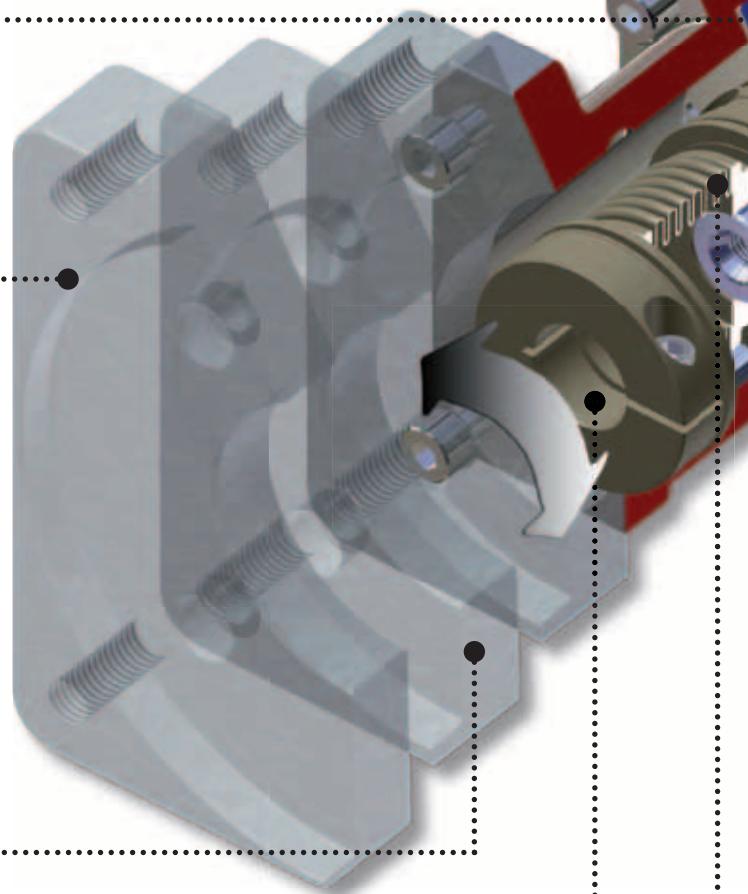

Modularity

- Exchangeable flange plates
- High flexibility
- For all common servo motors
- Available for over 120 standard motor flange plates

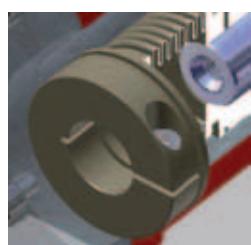

Servomotor Connection

- Exchangeable flange plates, flange dome and coupling
- Possible to fit to almost all of the available servo motors on the market

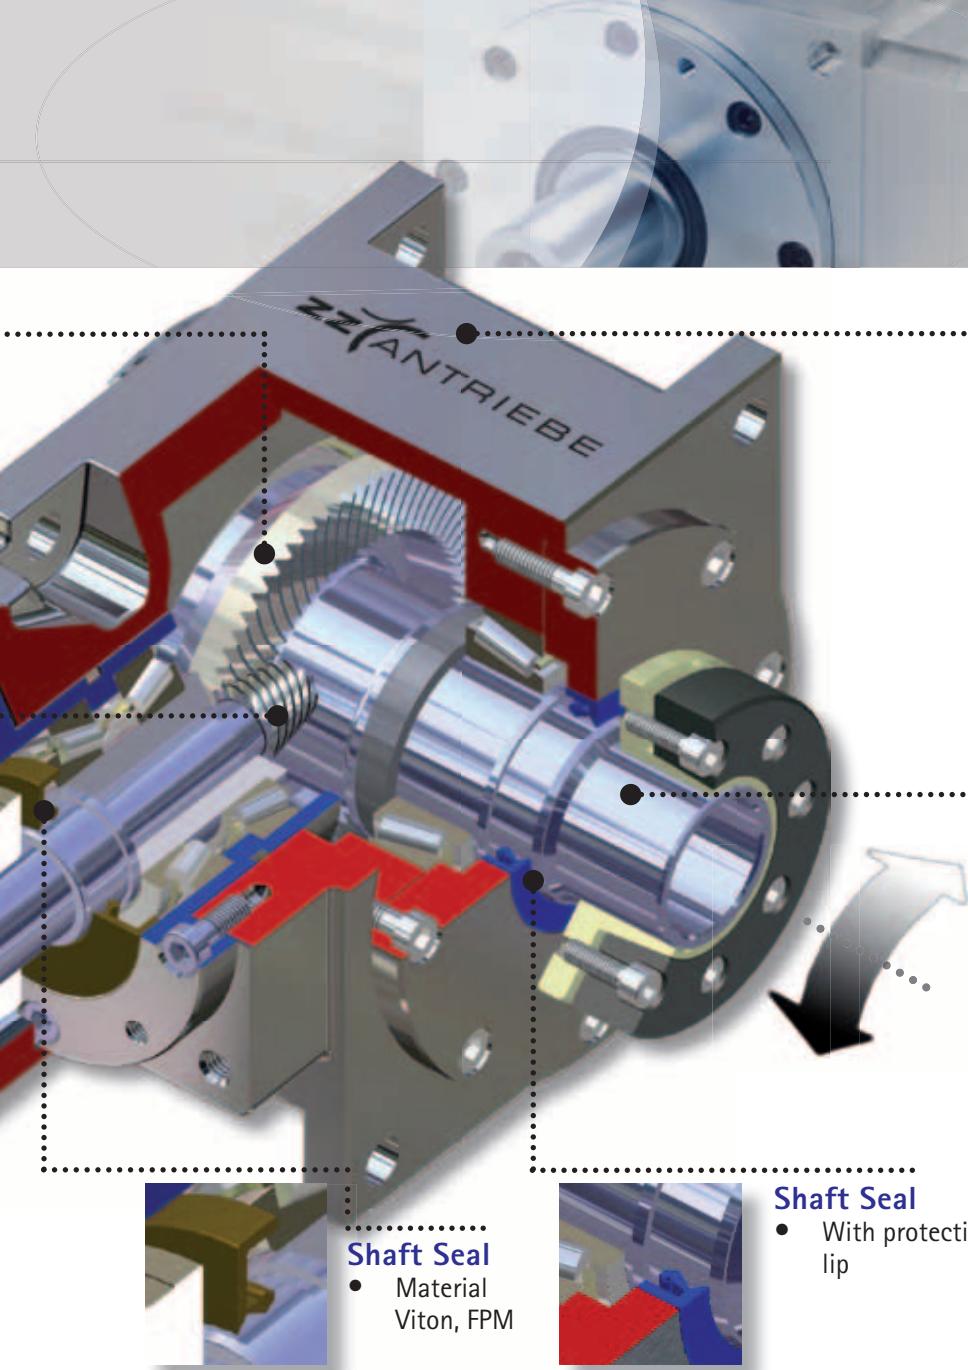

Speed Range

- High nominal input speed
- Maximum input speed up to 8000 rpm

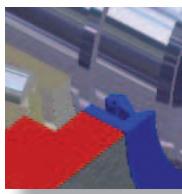

Coupling

- Torsionally rigid
- High concentricity
- Low inertia
- Matched for all currently available servo motors

Shaft Seal

- Material Viton, FPM

Shaft Seal

- With protection lip

Characteristic Values

- 6 Sizes of model
- 8 Gear ratios
- 6 Different drive shafts
- More than 280 standard types

Sizes and Output Torques

• KN0035	35 Nm
• KN0070	70 Nm
• KN0140	140 Nm
• KN0260	260 Nm
• KN0700	700 Nm
• KN1400	1400 Nm

Types of output Shafts

- Solid shaft, single and double sided
- Hollow shaft, single, extended, for shrink disks
- Block flange, robot flange (DIN EN ISO 9409-1)

Material

- Housing and flange of aluminium
- Shafts of tempered steel

Lubrication

- Lifetime lubrication
- Factory filled with special hypoid oil

Mounting Position

- Suitable for any optional mounting orientation

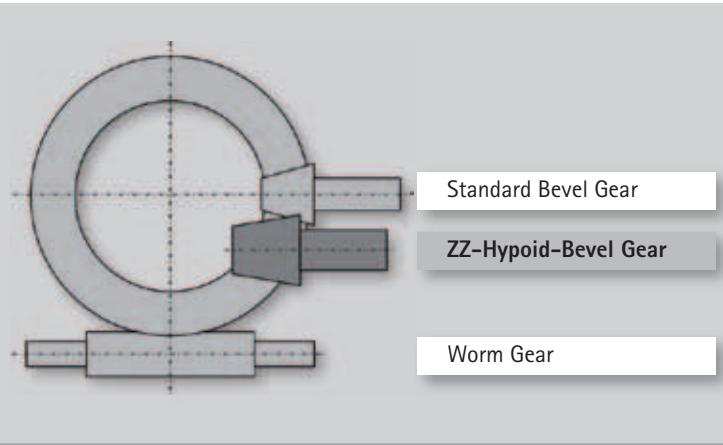

Available Options

	K1	K2	K3	K4	K5	K6
Without motor flange						
With motor flange						

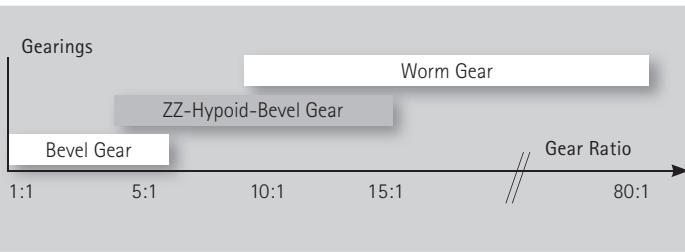

Observe the shaft rotational direction for all mounting positions of the upper mounted drive shaft according to the cross sectional drawing

The bevel gearbox range ZZ-Servoline® has been designed as a compact drive unit especially for highly dynamic uses in the automatic control engineering.

The range offers six gearbox sizes each with eight transmission ratios and six different drive shafts which allow more than 280 standard basic configurations. The single gearbox with mathematically exact transmission ratios with a range of $i = 3:1$ to $i = 15:1$ is based on a special hypoid gear with a positive offset.

The ZZ-Servoline® therefore closes and overlaps the transmission ratio gap due to the gearbox technical limitations between the bevel gear and the worm gear.

The practical requirements posed for servo motors are constructively implemented which is why the ZZ-Servoline® is used in universal applications with drive speeds up to 8000 rpm and output torques up to 1400 Nm.

For all transmission ratios within the same size, the gearbox has benefits with the same dimensions. The rotational direction of the shafts to each other is constructively set by the offset.

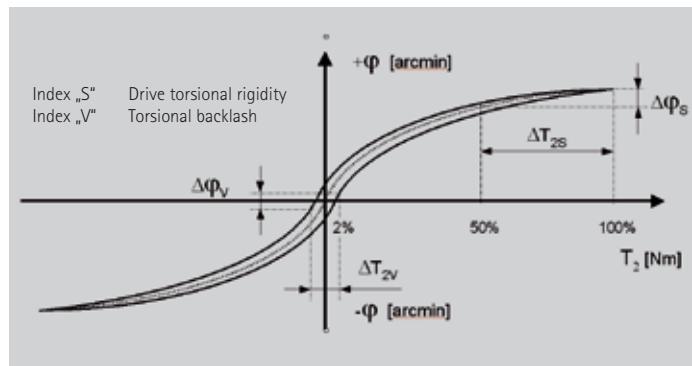

The ZZ-Servoline® can be used with or without the motor flange. At the driving end there are configurable single and dual ended solid shafts, hollow shafts and a block flange shaft for the assembly of handling devices. An optimised serration, generously dimensioned bearings and special hypoid oil are the basics for high operational safety.

For the values in the load table a smooth and even servo operation was used. Thereby the transferable performance is limited by the maximum allowable temperature of the housing and the oil bath. If, in continuous operation of the ZZ-Servoline® the rated torque is constant or less, then the serration is permanently fixed. In most applications the gearbox is closed (without pressure compensation) when being used, but with high rotational speeds and temperatures the implementation of a vent can be useful.

With frequently changing loads the input torque is applied to the gearbox through a frictional clamping element (without keyway). The output torque is transmitted to the machine through a shrink disc (without keyway).

The modular motor flange concept offers the flexibility of optimal customer usage. This way standard adapter plates suitable for the motor flange sizes can be selected and simply screwed into the gearbox side dome without any intervention in the gearbox. The modular system offers over 120 different motor adapters which makes possible the assembly to the ZZ-Servoline® with almost all available servo motors on the market.

From the ZZ-Servoline® hysteresis curve the performance characteristic of torsional backlash and the gearbox rigidity are sized.

The torsional backlash is determined with a low basic load while the gearbox rigidity is located with an almost linear deformation pattern in the upper load range.

The ZZ-Servoline® takes into account all requirements posed on modern gearbox concepts. It offers minimum torsional backlash, high rigidity, low overall weight, reduced inertia, high efficiency and with a universal assembly length, an almost maintenance free operation.

KN0035 TO KN1400 PERFORMANCE SUMMARY

The relevant rotational speeds for the design of the gear box are the nominal speed for continuous operation and the maximum drive speed that can be allowed sporadically in the cycle operation. With high ambient temperatures and high cycles all limits are to be reduced.

The gear boxes have manufacturing tolerances with the meshing engagement which can lead to slight variations in the running noise, torsional backlash and the synchronization. This can cause transmission ratio and angular deviations when used with positioning applications.

When the input shaft and the main dimensions are the same the basic gearbox of the ZZ-Servoline® is available in the variants K1 – K5 with a single sided solid shaft or a solid shaft on both sides, alternatively with a hollow shaft on the output side. All shaft ends are smooth, without keyways, and are prepared for the use of shrink disc clamping elements.

Output Styles: K1 bis K5

In all illustrations the drive shaft with the offset is always at the top

One side as a clamping hub (l_3 , d_3 , d_5) as extended hollow shaft is prepared for a wearfree and backlash free shrink connection.

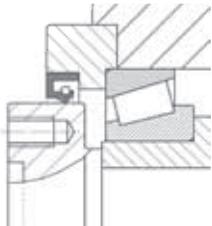

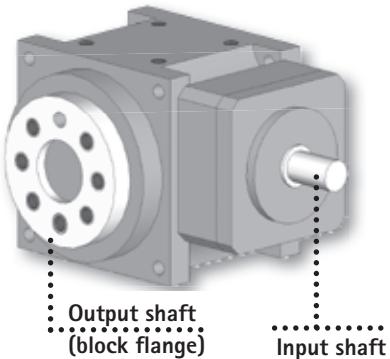

A slide bushing (d_3 , l_4) integrated in the hollow drive shaft prevents friction oxidation with long through shafts and makes possible an additional radial bearing.

KN0035 TO KN1400

DIMENSIONS K6 (BLOCK- AND ROBOT FLANGE) MOTOR MOUNTING OPTION

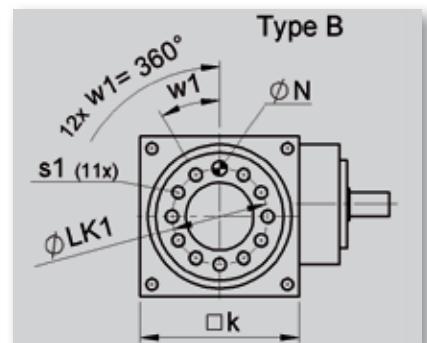

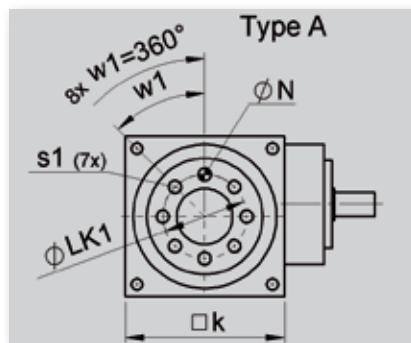

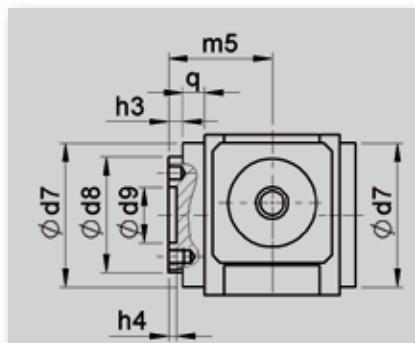

zz ANTRIEBE

The mechanical interface of the drive shaft flange corresponds to DIN EN ISO 9409-1 and is designed for the construction of handling devices and exchangeable end effectors with rounded flange.

A single piece flange shaft allows a high torsional rigidity of the drive. Non specified dimensions are according to the dimension sheet "Base Gearboxes".

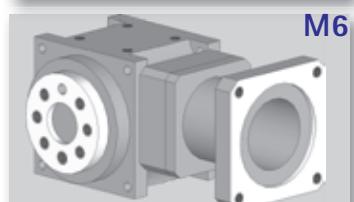

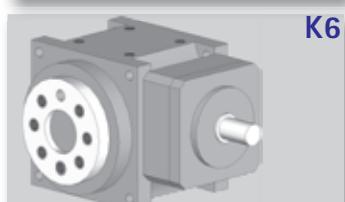

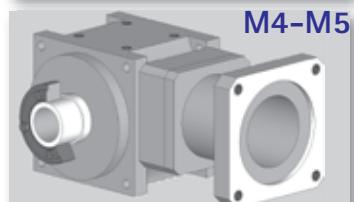

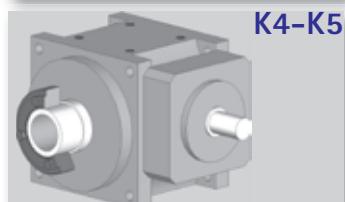

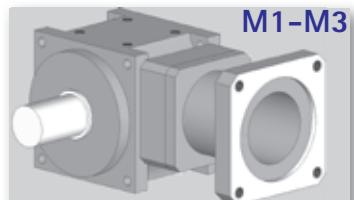

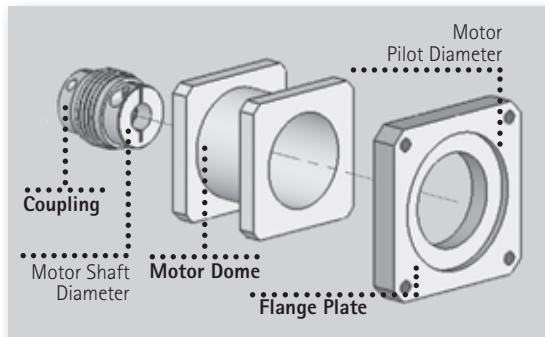

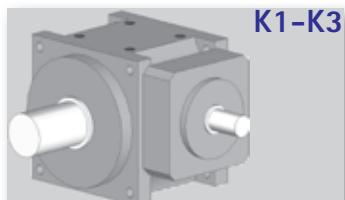

Output Style: K6

Gear Box with Motor Flange Mounting

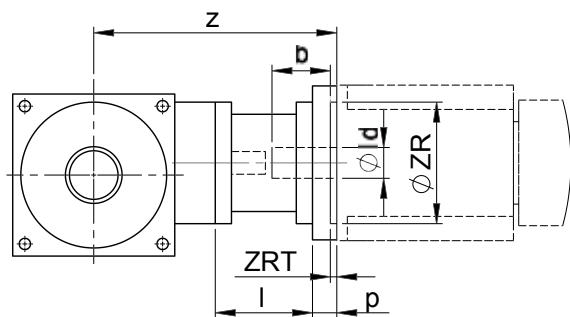

All basic gearboxes can be extended for the direct addition of servo motors by adding a motor dome, a clutch and an exchangeable adapter plate. The designs K1 - K6 are therefore supplemented with the desired flange and clutch to the M1 - M6 complete gear designs.

GEAR BOX WITH MOTOR FLANGE MOUNTING FLANGE DIMENSIONS KN0035 AND KN0070

Due to having a large selection of standard adapter plates, the **ZZ-Servoline®** can be easily configured for all common servo motors with rectangular flange connections. The main measurements of the flange are listed in the following table of dimensions. Length and diameter of the servo motor shaft must be within the dimensional specifications (w, d). The flange type and the clutch bore (motor shaft diameter) are also defined in the order code for the entire gearbox with motor flange.

Dimensions for the gearbox not mentioned here can be taken from the table of dimensions.

Note: The Choice of flange is usually made by way of the dimensions of the motor. Here, the flange plate, motor dome and coupling are matched. The permissible diameter of the motor shaft must lie between d_{min} and d_{max} , the length between b_{min} and b_{max} . The on-going overview will be found under: www.zz-antriebe.eu

The equivalent bearing load is a combination of the gear reactive forces and the outer axial and radial forces on the shaft end. A complete calculation of the bearing service life and the allowable loads is only possible when the application parameters as well as the angle of inclination, the direction of acting forces and the tilting moments are known.

Size	Allowable forces and tilting moments								
	k	l2	m5	y1	y2	z2	F _{r_{max}} [N]	F _{a_{max}} [N]	M _{k_{max}} [Nm]
KN0035	90	35	57	36	25	63	2000	800	80
KN0070	115	40	62,5	38	28	70	3100	1200	140
KN0140	140	50	73	48	34	85	3800	1500	220
KN0260	170	60	87	55	38	100	6200	2500	440
KN0700	215	90	100,5	61	46	130	8000	3200	630
KN1400	260	110	132,5	78	55	165	13000	5200	1300

The allowable forces and tilting moments are valid for shaft measurements according to the catalogue.

Design Basis:

Collective load S5-40%, n2 = 400 min⁻¹

F_{r_{max}} max. allowable radial force to the centre journal (z2) or the block flange (m5) at the most unfavourable angle of inclination (α)

F_{a_{max}} max. allowable axial force to the centre journal (z2) or the block flange (m5) at the most unfavourable angle of inclination (α)

M_{t_{max}} max. allowable tilting moment to the drive shaft or the block flange shaft

By external force exerted on the centre shaft the following is valid:

$$\bullet \quad M_{t,1,2} = [F_a * R + Fr * (x+y_{1,2})] / 1000 \leq M_{t, \text{max}}$$

For speeds higher than n2 = 400 min⁻¹ the following applies:

- $Fr_{n2} = Fr_{(n2=400)} / (n2 / 400)^{1/3} \leq F_{r\max}$
- $Fa_{n2} = Fa_{(n2=400)} / (n2 / 400)^{1/3} \leq F_{a\max}$

High axial and radial forces occurring at the same time as high torque loadings is not allowed. With superimposed loads a factory recalculation of the gears is recommended.

Operating Modes

At typical usages of ZZ-Servoline® gearboxes a difference should be made between the operating modes, continuous operation (S1) and the cycle operation (S5). In which case the movement profile is either marked by frequent acceleration periods and periods of delay with pauses or there is an application with long periods of continuous operation.

The continuous operation is defined by the duty cycle. This is present when the switch-on duration is more than 60% of the cycle time or longer than 20 minutes. With the temperature critical application the nominal speed of the gearbox should not be exceeded without additional cooling because the transfer performance is limited by the thermal capacity. Temperature monitoring is recommended with this application.

The cycle operation is also determined by the switch-on duration. Whereby the switch-on duration is less than 60% of the process operation and less than 20 minutes. Whereby the maximum rotational speed should at no point in time be exceeded. A high number of cycles in connection with short acceleration times can lead to oscillations and torque overloads. With cycles of more than 1000/hrs. the allowable output acceleration torque is to be reduced (consultation with ZZ requested).

For the values in the performance table a smooth and even servo operation was used. Conversion for other modes of operation is to a limited extent possible when the application data is known. Principally for all operation modes the limits for rotational speed, torque, acceleration and temperature should be observed.

TRANSMISSION PRESELECTION ORDER CODE

The gear box preselection can take place according to the following, and should ensure the following three elements:

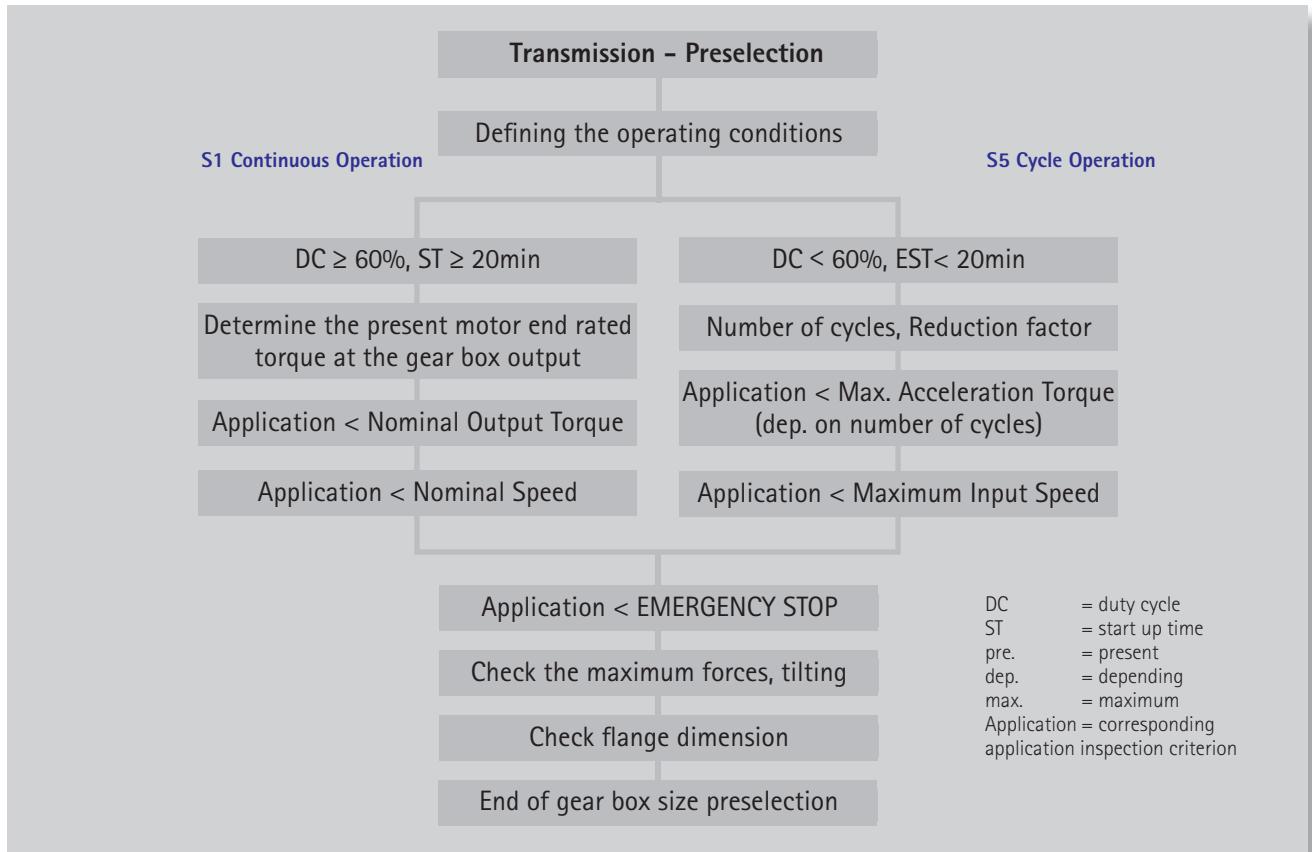

- fulfilment of the drive function
- the assurance of the mechanical stability
- a suitable thermal design

To determine the transferable torque or the rated power

the following information is required: operating conditions, collective load, mode of operation, number and type of gear changes per hour, start up time, duration of load, type of brakes, duration of braking, idle time, running time, duration of standstill and the power requirement.

Please state your operating information. We will be very happy to design the gear box for your application.

Gear box preselection sequence of events

Basis Gear with motor flange combinations (gear with motor flange, dome and coupling)														

The core of our competence, from the idea to the finished gear

Engineering and Design
of all common types of toothed components and gears

Calculation and Design
of movement processes, kinematic chains, subassemblies and drives

Service
and extensive consultation with support in all engineering processes

ZZ-Bevel Gear Units
up to 7000 Nm nominal torque or 500 kW power. ZZ Servoline® series for high-dynamic drives

ZZ-Hirth-Couplings
Self centering, two and three pieces, form lock connection with a high contact ratio in standard and special form

ZZ-Cam gear boxes
as globoid, disc cams or cylinder cam gearboxes with application optimised special movement functions

ZZ-Spiral Bevel Gear Wheels
- palloid toothed
- cyclo-palloid toothed
- HPG-S toothed

ZZ-Cams
as - globoid cams
- axial cams
- radial cams

ZZ-Special gear boxes
as special gear boxes for use in the printing and packaging industry as well as for general industrial automation.
