

SERIES C1100

- ✓ Absolute / relative positioning commands
- ✓ Limited jerk motion commands
- ✓ Time Curves
- ✓ PLC or Stand-Alone Solutions
- ✓ Digital and Analog IO's
- ✓ Safe Torque Off
- ✓ Interface for optional incremental or absolute sensor
- ✓ Supports Plug and Play
- ✓ CE / UL / CSA

Servo Drive C1100

Series C1100 servo drives are axis controllers, with 32-bit position resolution and an integrated power stage, for linear motors and rotary drives.

The controllers are suitable for simplest and standard positioning tasks with point to point motions.

CONNECTION TO MACHINE CONTROL

The C1100 servo drives can be actuated by machine controls from many manufacturers or brands, via digital inputs and outputs, over CAN Bus or Industrial Ethernet.

Bus-Interfaces:

- » Profinet
- » EtherCat, SoE, CoE
- » CANopen

Serial Interfaces RS422 / RS485:

- » LinRS

PROCESS AND SENSOR INTERFACES

Fast process interfaces for direct processing of sensor signals are available as freely programmable analog and digital inputs, a fast trigger input, and a capture input.

The safety IO's on Servo Drives with the -1S option with CAN or industrial ETH-ERNET allows safe torque off (STO) of the drives via control signals, without interrupting the power supply.

Drives with -0S option come without safety IO's and are easier to wire in applications without safety needs.

LOGIC AND POWER SUPPLY

The servo drives have two separate inputs for the logic supply and motor elements.

This has the advantage that the drive and linear motor do not need to be reinitialized when the machine is restarted, since all process data, including the actual position of the linear motor, is still up to date.

System Integration

Flexible hardware enables control of many 1/2/3-phase motors. Thus, low-power rotary servomotors, such as brushless DC motors, can be integrated in the same control concept.

Additionally, the drives can be equipped with optional peripherals, such as reference and end stop switches, high-precision external position sensors, or a mechanical holding brake.

Series C1100 servo drives have analog inputs and digital inputs and outputs, serial interfaces, CAN bus, and Ethernet. The user therefore is not dependent on the selection of the higher level controller. An appropriate interface is available, with associated protocols, for many PLC or IPC solution.

With flexibility and a compact form factor, LinMot Series C1100 servo drives provide a complete solution for a flexible drive concept in single and multiple axes applications, with linear motors and other actuators.

IDEAL FOR POINT TO POINT MOTIONS

Serial interfaces, CAN and industrial Ethernet guarantees flexible and fast communication.

The cost-optimized design of the C1100 series make it the ideal drive for point-to-point motions and replacement of pneumatic cylinders. The control is also characterized by higher speeds, longer service life and high flexibility.

MOTOR INTERFACES

C1100 servo drives provide all necessary interfaces to operate linear or rotary motors with optional external peripherals, such as end position and reference switches, a mechanical brake, or a high-resolution external position sensor.

CONFIGURATION

LinMot Talk, a user-friendly PC software is available for configuration. In addition to online documentation, LinMot Talk provides extensive debugging tools, such as an oscilloscope and an error inspector, for simple and rapid start-up of the Axis.

Fieldbus and Ethernet drives can also be configured directly by the higher level control, by downloading the configuration parameters via Bus/Ethernet

CONNECTION TO MACHINE DRIVE

For direct position targets, using absolute or relative positioning, the desired position is reached using acceleration and velocity-limited motion profiles, sine motion profiles or jerk optimized profiles (jerk limited Bestehorn). Positioning commands can be invoked via the serial interfaces, CANopen, Ethernet or a trigger input.

Stroke range:	±100 m
Position Resolution:	0.1 µm (32Bit)
Velocity Resolution:	1.0 µm/s (32Bit)
Acceleration Resol.:	10.0 µm/s ² (32Bit)

TIME CURVES

Up to 50 different time curves can be stored Series C1100 drives, with up to 8'110 individual waypoints. The motor can thus travel along time curves of any complexity, such as those generated by CAD programs and stored in the drive (Excel CSV format). The time curves can be invoked via the serial interface, fieldbuses, Ethernet, or the trigger input.

Stroke range:	±100m
Position Resolution:	0.1 µm (32Bit)
Motion profiles:	Max. 50 Time Curves
Curve points:	Max. 8'110 points

11

PROFILED MOVES

For travel to an absolute position, or shifting by a relative position, any desired motion rules can be stored besides the VA interpolator. They are stored in the drive as motion profiles (Excel CSV format). The positions can be approached, for example, with a sinusoidal motion to optimize power loss, or special reverse optimized motion profiles.

Stroke range:	±100m
Position Resolution:	0.1 µm (32Bit)
Motion profiles:	Max. 50 Time Curves
Curve points:	Max. 8'110 points

SETPOINT STREAMING

Higher level NC motion controllers with fieldbus or Ethernet interfaces communicate with the servo drives via "Position Streaming". The position and velocity calculated in the higher level control is transmitted to the Servo Drive cyclically. The P, PV, or PVT mode is available for this transmission.

Position Resolution:	32 Bit
Velocity Resolution:	32 Bit
Interpolator:	4 kHz
Cycle times:	0.5 - 5 ms

EASY STEPS

Input 1	Pos 125 mm
Input 2	Pos 250 mm
Input 3	Curve 1
Input 4	Pos -30 mm

With the Easy Steps function, up to 4 positions or independent travel commands can be stored on the drive, and addressed via 4 digital inputs or fieldbus interfaces/Ethernet.

Digital inputs: 4
Interface: X4
Scanning rate: 250 µsec

COMMAND TABLE

Entire motion sequences with up to 255 individual motion commands can be stored in the Command Table. This is primarily advantageous if complete motion sequences need to be executed very quickly, without dead time from the higher level drive. In the Command Table, the programmer has access to all motion commands, internal parameters, and digital inputs and outputs.

Commands: max. 254
Cycle time: 250 µsec

ANALOG POSITION

For an analog position target, the linear motor travels to a position proportional to the input voltage. The position is either scanned continuously, or only after a rising edge of the trigger signal. In order to prevent uncontrolled jumps in position, the motor travels to the positions with a programmable maximum acceleration and velocity (VA interpolator).

Inputs: Analog Input X4
Voltage range: 0-10VDC or ±10V
Resolution: 10 Bit
Scanning rate: >=250 µsec (adjustable)

EASY STEPS PARAMETER SCALE

Easy Steps provide the ability to parameterize internal parameters using two analog inputs. If, for example, the maximum motor current is read at an analog input, then the maximum motor force can be provided as analog for freely programmable joining processes.

Inputs: 2 x Analog
Voltage range: 0-10VDC
Resolution: 10 Bit
Scanning rate: 250 µsec

CLOSED LOOP FORCE CONTROL

Using the force control technology function, precise joining processes can be implemented reliably and reproducibly with high-precision force control. For force control, the current motor force is measured with a load cell and controlled in the drive. Joining process or quality checks with high requirements for applied force can be implemented.

Analog input:	0-10V or $\pm 10V$
Resolution:	10 Bit
Min. Force Resolution:	0.1N

CANopen

11

CANOPEN

The LinMot C1100-GP drives support the CiA DS301 communications protocol. The following resources are available:

4 T_PDO, 4 R_PDO, 1 T_SDO, 1 R_SDO

The following protocols are supported by the CO drives:

- » NMT Error Control (Nodeguarding Protocol or HeartBeat Protocol)
- » PDO (Transmission type 1 to 254)
- » SDO Upload and Download
- » NMT (Start, Stop, Enter PreOp, Reset Node, Reset Communication, Boot-Up Message)

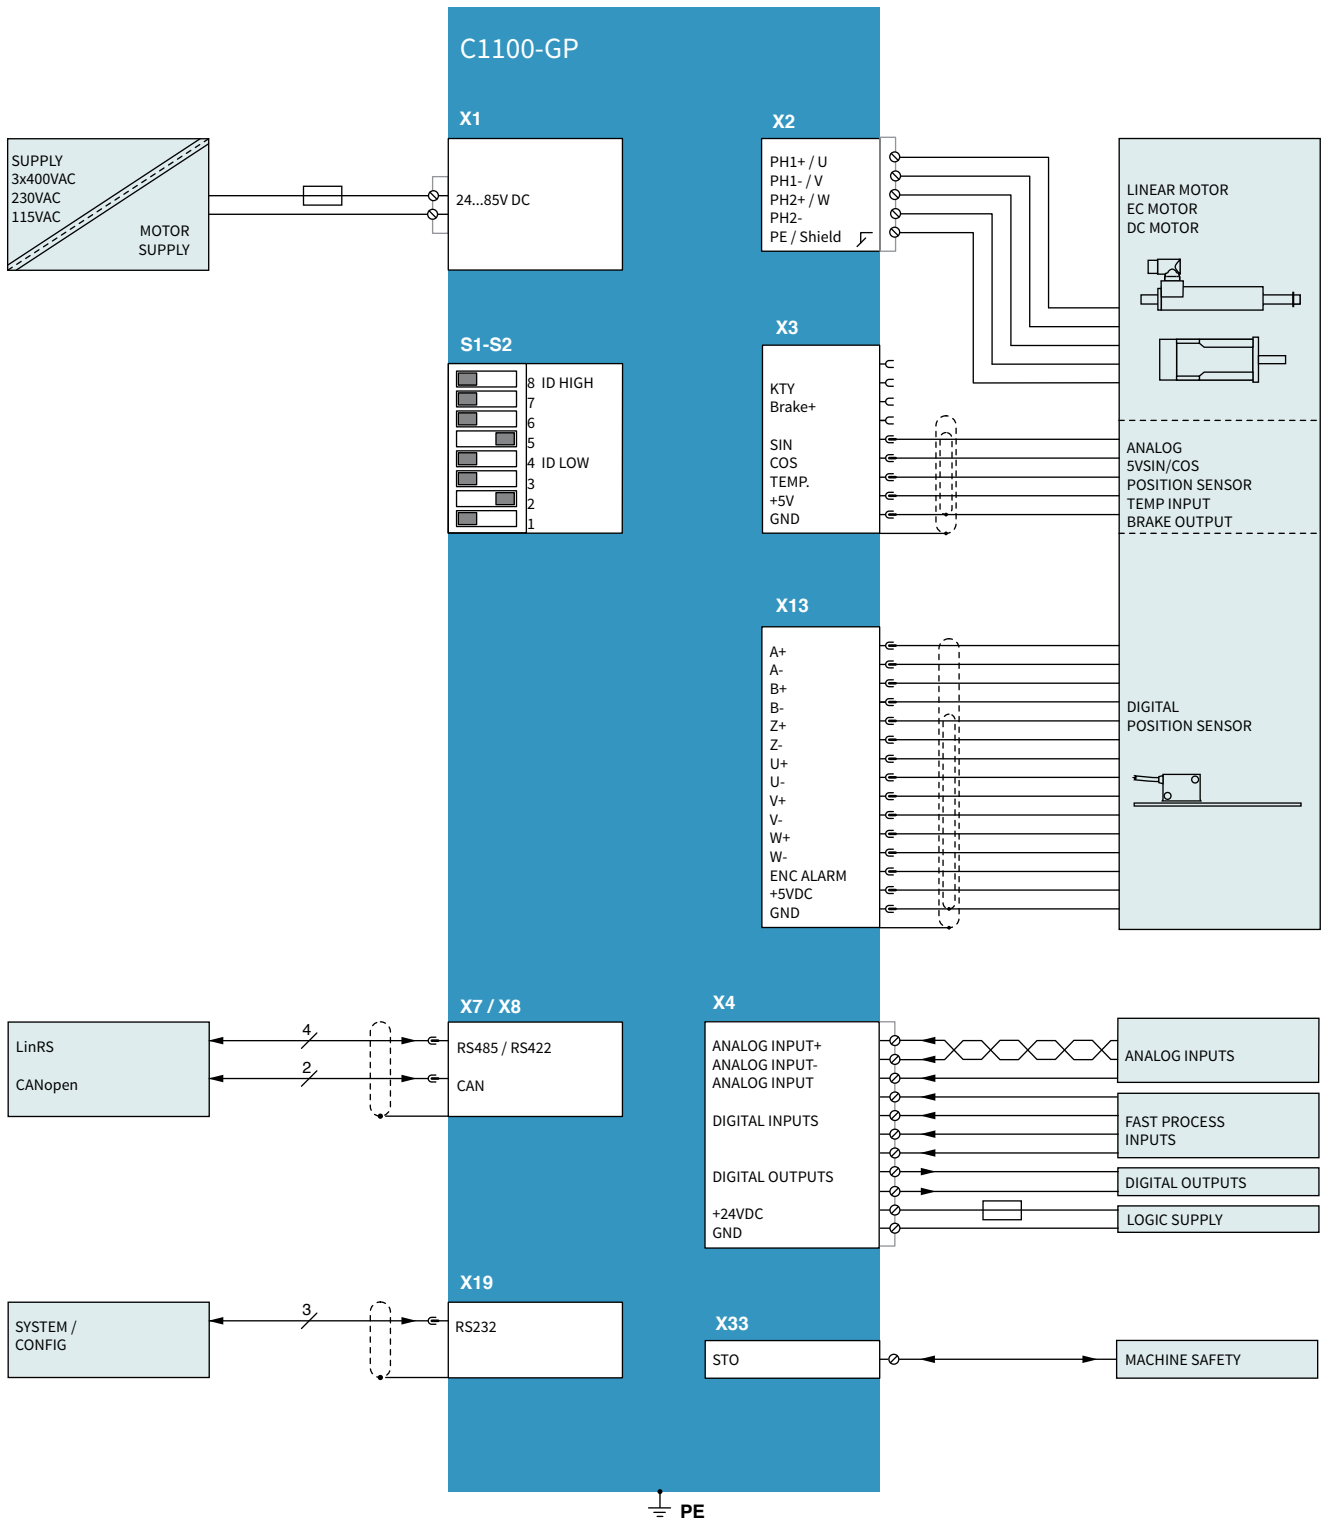

PROCESS AND SENSOR INTERFACES

C1100-GP servo drives support the following interfaces:

- » CANOpen
- » LinRS

MINIMAL CYCLE TIMES

Min. Bus Cycle:	500 µs
IO update:	500 µs
Trigger Input:	250 µs
Position control loop:	250 µs
Current control loop:	125 µs

INDUSTRIAL ETHERNET

Series C1150-EC drives allow integration of LinMot linear motors in controls concepts with EtherCAT. The user can integrate Series C1100 drives regardless of the provider of the higher level control.

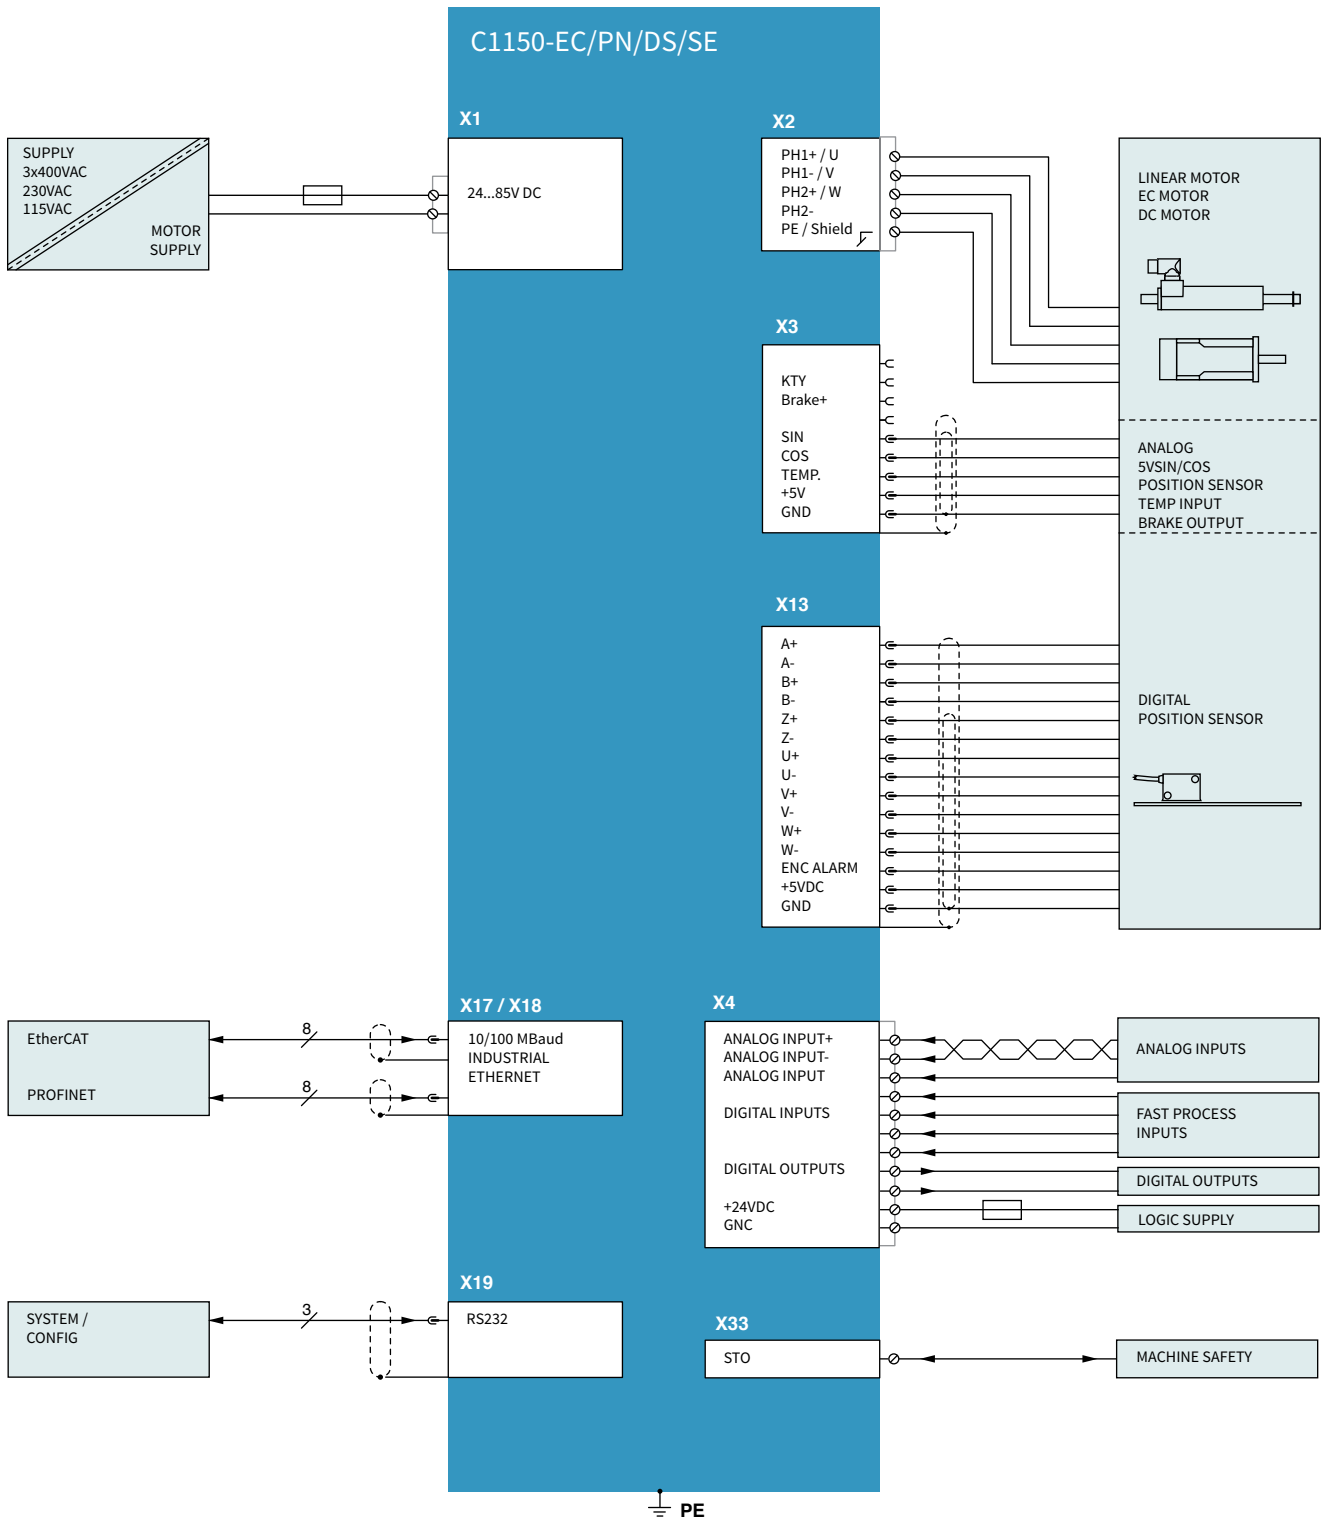

LinMot drives are available with common industrial Ethernet protocols. Since all Ethernet drives have the same motion command interface, and the control and status word are identical, software blocks that have been implemented once, can be transferred to other motion controllers without a problem.

TECHNICAL DATA

Type: Realtime Ethernet
 Switch/Hub: Integrated 2-Port Switch
 Transfer rate: 10/100MBit/sec

MINIMAL CYCLE TIMES

Bus cycle: 500 μ s
 IO update: 500 μ s
 Trigger Input: 250 μ s
 Position control loop: 250 μ s
 Current control loop: 125 μ s

X1 MOTOR SUPPLY

Connector has to be ordered separately

Motor Supply: 72VDC nominal, 24...85VDC
 Absolute max. Rating: 72VDC +20%.
 External Fuse: 16A slow-blow / min. 100VDC
 If motor supply voltage exceeds 90VDC, the drive will go into error state.

- » Use 60/75°C copper conductors only
- » Conductor Cross-Section 2.5mm² (AWG14) max Length 3 m

X2 MOTOR PHASES

Connector has to be ordered separately

Nr	Designation	LinMot Linear Motor	Color	3-phase EC-Motor	Color
1	PH1+	Motor Phase 1+	red	Motor Phase U	red
2	PH1-	Motor Phase 1-	pink	Motor Phase V	pink
3	PH2+	Motor Phase 2+	blue	Motor Phase W	blue
4	PH2-	Motor Phase 2-	grey	RR-	grey
5	PE/SCRN	Shield		Shield	

- » Use 60/75°C copper conductors only
- » Conductor cross-section: 0.5 – 2.5mm² (depends on Motor current) / AWG 21 -14

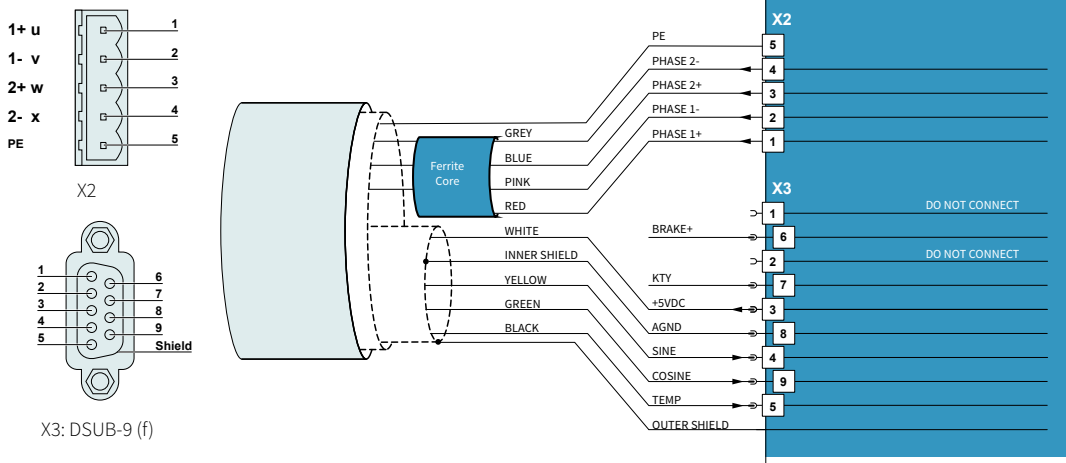

X3 MOTOR SENSOR / BREMSE

DSUB-9

Nr		LinMot Motor	EC Motor
