

*your reliable partner*

**ROBA<sup>®</sup>-linearstop**

## Expert know-how in development and design

As the technological leader, *mayr*® power transmission focuses on continuous further development. Today, highly qualified engineers and technicians work on tomorrow's innovations using the most up-to-date tools. The many years of experience and countless tests in the Development and Testing Department at the Mauerstetten Headquarters form the basis of conscientious lifetime dimensioning.

The values upheld by our traditional, family-run company also include long-term stability and independence as well as a good reputation and satisfied customers.

Therefore, we place emphasis on:

- Tested product quality,
- Optimum customer service,
- Comprehensive know-how,
- Global presence,
- Successful innovations and
- Effective cost management

## Tested quality and reliability

*mayr*® brakes and clutches/couplings are subject to meticulous quality inspections. These include quality assurance measures during the design process as well as a comprehensive final inspection. Only the best, tested quality leaves our place of manufacture. All products are rigorously tested on calibrated test stands, and adjusted precisely to the requested values. An electronic database in which the measured values are archived together with the associated serial numbers guarantees 100 % traceability. On request, we confirm the product characteristics with a test protocol.

The certification of our quality management according to DIN EN ISO 9001:2015 confirms the quality-consciousness of our colleagues at every level of the company.

## Specialists in power transmission for more than a century

*mayr*® power transmission is one of the most traditional and yet most innovative companies in the field of power transmission. From modest beginnings in the year 1897, the family enterprise has developed to become the world market leader. Worldwide, the company employs approximately 1200 people.

### An unsurpassed standard product range

*mayr*® power transmission offers an extensive range of variants of torque limiters, safety brakes, backlash-free shaft misalignment compensation couplings and high-quality DC drives. Numerous renowned machine manufacturers trust in solutions by *mayr*® power transmission.

### Represented worldwide

With eight subsidiaries in Germany, sales offices in the USA, France, Great Britain, Italy, Singapore and Switzerland as well as 36 additional country representatives, *mayr*® is available in all important industrial areas, guaranteeing optimum customer service around the globe.

## Strongly positioned

*mayr*® sets standards in power transmission with economically viable solutions. For maximum competitiveness of your machines and systems, we always aim for the best possible cost efficiency, starting with the development of your clutch/coupling or brake, right up to delivery of the finished and inspected product. For cost-efficient production, our factories in Poland and China represent the perfect supplement to the headquarters in Germany.

## Never compromise on safety

We make no compromises where safety is concerned. Only top products of a perfect quality guarantee that no people are injured or machines damaged in case of malfunctions, collisions and other hazardous situations. The safety of your employees and machines is our motivation to always provide the best and most reliable clutches, couplings or brakes.

*mayr*® power transmission holds numerous ground-breaking patents, and is the global market or technological leader for

- application-optimised **safety brakes**, for example for passenger elevators, stage technology and gravity-loaded axes
- **torque limiters** to protect against expensive overload damage and production losses and
- backlash-free **servo couplings**.

## ROBA<sup>®</sup>-linearstop

the perfect safety brake for linearly moved axes

### Versatile use as safety brake or clamping unit

As a new brake system, the ROBA<sup>®</sup>-linearstop offers unique possibilities for increasing the safety of machinery. As a compact brake unit it can be integrated into already existing machinery and system constructions easily, quickly and without extensive adjustment work. The unit having a direct effect on the rod brakes independently from the drive system.

Die ROBA<sup>®</sup>-linearstop pneumatic can be attached to standardized cylinders acc. ISO 15552.

The ROBA<sup>®</sup>-linearstop pneumatic is not only a holding device, but can also brake dynamically on a rod. The system has been designed according to the "Principles for the inspection and certification of pneumatic braking/holding devices with safety function for linear drives" of the German Trade Association Institute for Work Safety (BIA Berufsgenossenschaftliches Institut für Arbeitsschutz) and has been tested by the **TÜV-SÜD** (German Technical Inspectorate).

The new electromagnetic ROBA<sup>®</sup>-linearstop is designed as a clamping unit.

#### ROBA<sup>®</sup>-linearstop in an endurance test on a drop test stand

On the *mayr*<sup>®</sup> drop test stand specially designed for linear brakes, the braking force, dynamic braking path, switching times and position accuracy can be tested extensively.

#### Arrangement of the hydraulically actuated safety brake

ROBA<sup>®</sup>-linearstop in a universal lathe.

- Piston rod secured on one side

# ROBA<sup>®</sup>-linearstop

## Hydraulic – Pneumatic – Electromagnetic

### Highlights and Advantages

- ☐ Safety brake system according to the fail-safe principle
- ☐ Backlash-free force transmission in both directions of motion
- ☐ No self-reinforcement during clamping
- ☐ Clearing the clamping device is not necessary
- ☐ Maximum performance density
- ☐ Suitable for EMERGENCY STOP braking actions
- ☐ Suitable for dynamic braking actions
- ☐ Minimum reaction times
- ☐ Integrated switching condition monitoring possible
- ☐ Long service lifetime
- ☐ Can easily be integrated into existing constructions

### ROBA<sup>®</sup>-linearstop hydraulic

#### Type 380.01 \_ \_ 0

Clamps a piston rod via a spring-loaded device at the exact position required and backlash-free. The brake is opened

with a hydraulic pressure of 35 – 75 bar.

Suitable for EMERGENCY STOP braking actions.

Nominal holding force: 4000 – 50000 N

For data and description, please see pages 6/7.

### ROBA<sup>®</sup>-linearstop pneumatic

#### Type 381. 0 \_ \_ . \_ \_ (acc. Trade Association test regulation)

Clamps a piston rod via a spring-loaded device at the exact position required and backlash-free. The brake is opened with a pneumatic pressure of 4 – 6 bar.

Suitable for EMERGENCY STOP braking actions

(tested by TÜV-SÜD, German Technical Inspectorate).

#### Type 381. 1 \_ \_ . \_ \_ for dynamic braking actions (acc. Trade Association test regulation)

Clamps and brakes a piston rod via a spring-loaded device at the exact position required and backlash-free. The brake is opened with a pneumatic pressure of 4 – 6 bar. If the Technical Data are observed, more than 20,000 dynamic braking actions are possible (tested by the **TÜV-SÜD**, German Technical Inspectorate).

Nominal holding force: 450 – 40000 N

For data and description, please see pages 8/9.

### ROBA<sup>®</sup>-linearstop electromagnetic

#### Type 3820.0 \_ \_ 0 \_

Clamps a piston rod via a spring-loaded device at the exact position required and backlash-free. Brake is opened through electromagnetic actuation with DC current.

Suitable for EMERGENCY STOP braking actions.

Nominal holding force: 70 – 17000 N

For data and description, please see pages 12/13.

## ROBA®-linearstop hydraulic

Fig. 1

### State of Delivery

**ROBA®-linearstop** brakes are manufacturer-assembled ready for installation and set to the nominal holding force stipulated in the order.

If the customer does not stipulate a force adjustment in the order, the brake is set to the maximum nominal holding force acc. Table "Technical Data".

### Important!

If installation is to be carried out without pressurization, the three emergency release screws (7) must be screwed in up to their limits (state of delivery).

**Before initial operation, please read and observe the respective Installation and Operational Instructions.**

### Function

Due to the spring-loaded system, the fail-safe principle is guaranteed, and the **ROBA®-linearstop** works as a safety brake. For the required release pressure (operating pressure), please see Table "Technical Data".

The max. sliding speed is 2 m/s.

For permitted friction work in case of EMERGENCY STOP braking actions, please contact *mayr®* power transmission.

The spring-loaded, enclosed **ROBA®-linearstop**, which can be opened hydraulically, clamps a customer-side piston rod steplessly and backlash-free.

Fig. 2

### Maintenance/Switching Frequency

The **ROBA®-linearstop** is designed for a switching frequency of 1.000.000 switchings (higher switching frequencies available on request).

The **ROBA®-linearstop** is largely maintenance-free.

The piston rod must be checked regularly (at least every 6 months) for contamination with friction value-reducing materials; it must be cleaned, if necessary.

In case of major accumulation of dust and dirt, or in extreme ambient conditions, special maintenance work is required. (Please contact *mayr®* power transmission).

- 1) Minimum holding force when the brake is not pressurised and when the piston rod is dry or moistened with mineral oil.
- 2) Please contact *mayr*<sup>®</sup> power transmission if
  - a nominal holding force other than the one stated is required
  - the required minimum operating pressure is not available.
- 3) At a switching frequency > 200.000, please reckon with a nominal holding force reduction of 20 %.

### Options (see also order number, page 6)

Switching condition monitoring  
(Type 380.011.0)

Fig. 4

### Brake Rod

The *mayr*<sup>®</sup> power transmission recommends the use of piston rods.

#### Piston rod requirements

→ see page 11

At higher loads, we recommend using a higher strength material.

Yield point	min. 520 N/mm <sup>2</sup> (e. g. 42CrMo4)
-------------	--

### Controls (Fig. 3)

The company *mayr*<sup>®</sup> power transmission recommends hydraulic controls as shown in Fig. 3. During every operating movement of the piston rod, the 3/2-directional control valve is switched electrically and the linear brake is released. In all other operating conditions, the piston rod is held by the linear brake.

#### Recommendation:

- Pressure fluctuations can be reduced through a non-return valve.
- In order to guarantee fastest possible switching of the brake, the largest possible line diameter should be used in the area of the return flow line. Furthermore, do not install any choke valves in this area and keep the hydraulic lines between the brake and the valve as short as possible!

Fig. 3

Item	Name
1	Pressure source
2	Non-return valve (in case of pressure fluctuations)
3	3/2-directional control valve
4	Pressure switch: Switching point <0.5 bar (brake closed) • <b>Brake must not be pressurised</b>
5	Pressure switch: Min. operating pressure (brake opened) • <b>Minimum operating pressure must be used</b> □ In case of pressure fluctuations □ In case of pressure drop e.g. leakages

## ROBA®-linearstop pneumatic

# ROBA<sup>®</sup>-linearstop pneumatic

## Technical Explanations

### State of Delivery

**ROBA<sup>®</sup>-linearstop** brakes are manufacturer-assembled ready for installation and set to the nominal holding force stipulated in the order.

**Before initial operation, please read and observe the respective Installation and Operational Instructions.**

### Function

The spring-loaded, enclosed ROBA<sup>®</sup>-linearstop (Type 381.0\_ \_ \_), which can be opened pneumatically, clamps a piston rod steplessly and backlash-free.

The ROBA<sup>®</sup>-linearstop (Type 381.1\_ \_ \_) clamps and brakes a piston rod steplessly and backlash-free.

Due to the spring-loaded system, the fail-safe principle is guaranteed, and the **ROBA<sup>®</sup>-linearstop** works as a safety brake. For the required operating pressure, please see Table "Technical Data". The max. sliding speed is 2 m/s.

### Maintenance/Switching Frequency

The ROBA<sup>®</sup>-linearstop is designed for a switching frequency of 2.000.000 switchings (higher switching frequencies available on request).

The ROBA<sup>®</sup>-linearstop is mainly maintenance-free.

The piston rod must be checked regularly (at least every 6 months) for contamination with friction value-reducing materials; it must be cleaned, if necessary.

In case of major accumulation of dust and dirt, or in extreme ambient conditions, special maintenance work is required.

(Please contact mayr<sup>®</sup> power transmission).

### Controls (Fig. 8)

The piston space is filled with compressed air, thus suspending the spring force. The compressed air in the piston space is deduced in case of power failure. The spring force has an effect on the clamping element. The piston rod is clamped/ braked reliably and safely.

The company mayr<sup>®</sup> power transmission recommends the following pneumatic control units.

Controls for switching time-related applications

Recommendation!

For applications to optimize the switching time  
(reduction of the braking distance)

Controls for safety-related applications

Recommendation!

For applications to optimize the safety  
(in case of danger to people)

Fig. 8

Item	Name
1	Pressure source 4 – 6 bar
2	Maintenance unit
3	Pressure reducer (switching time-related application)
4	Non-return valve (in case of pressure fluctuations)
5	3/2-directional control valve
6	Quick-action ventilating valve (switching time-related application)
7	Pressure switch: Switching point <0.5 bar (brake closed) • <b>Brake must not be pressurised</b>
8	Pressure switch: Min. operating pressure (brake opened) • <b>Minimum operating pressure must be used</b> <input type="checkbox"/> In case of pressure fluctuations <input type="checkbox"/> In case of pressure drop e.g. leakages

Please find a detailed description in the respective Installation and Operational Instructions (go to [www.mayr.com](http://www.mayr.com)).

Fig. 13

### Installation (on both sides)

Fig. 14

### Positioning flange

Fig. 15

## Brake Rod

The company **mayr**<sup>®</sup> power transmission recommends the use of hard chromium-plated piston rods (induction hardened).

### Piston rod requirements\*

	Steel, hard chromium-plated
Layer thickness	Minimum layer thickness for rod diameter <20 mm = 10 µm / >20 mm = 20 µm
Hardness	at least HRC 56
Surface quality	Ra < 0.4 µm
Yield point	min. 400 N/mm <sup>2</sup> (e.g. C45)
<b>Diameter tolerance</b>	
Type 380, 381	h7 to f7
Type 3820	f7

\*) Piston rods are available as piece goods. Please contact the sales employee responsible or the company **mayr**<sup>®</sup> directly.

For the installation of the brake, we recommend an insertion chamfer (rounded edges) on the piston rod of min. 3 x 20 ° (Figure 16). Friction value reducing residues on the piston rod must be avoided. Danger of load crashes.

Fig. 16 Piston rod with insertion chamfer

## ROBA®-linearstop electromagnetic

Fig. 17

### Technical Explanations

#### State of Delivery

ROBA®-linearstop brakes are manufacturer-assembled ready for installation and set to the nominal holding force stipulated in the order.

**Before initial operation, please read and observe the respective Installation and Operational Instructions.**

#### Function

Due to the spring-loaded system, the fail-safe principle is guaranteed, and the ROBA®-linearstop works as a safety brake. The max. sliding speed is 2 m/s.

For permitted friction work in case of EMERGENCY STOP braking actions, please contact mayr® power transmission.

The spring-loaded, enclosed ROBA®-linearstop, which can be opened electromagnetically, clamps a piston rod steplessly and backlash-free.

#### Maintenance/Switching Frequency

The ROBA®-linearstop is designed for a switching frequency of 200.000 switchings (higher switching frequencies available on request).

The ROBA®-linearstop is largely maintenance-free.

The piston rod must be checked regularly (at least every 6 months) for contamination with friction value-reducing materials; it must be cleaned, if necessary.

In case of very dusty or dirty conditions or in extreme ambient conditions, special maintenance work is necessary (please contact mayr® power transmission).

### Keys

- U<sub>H</sub> = Holding voltage
- U<sub>N</sub> = Coil nominal voltage
- U<sub>O</sub> = Overexcitation voltage
- U = supply voltage

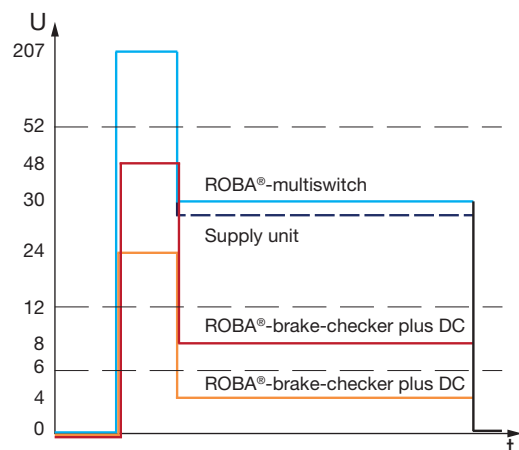

## Brake Rod

The company *mayr*® power transmission recommends the use of piston rods.

### Piston rod requirements

→ see page 11

We reserve the right to make dimensional and constructional alterations.

Time Diagram: Operation of the brake

For opening of the ROBA®-linearstop electrical, it is switched on with overexcitation voltage, meaning with a substantially higher-voltage than the coil nominal voltage.

When switched on, the DC voltage module briefly outputs over-excitation voltage to the magnetic coil.

# Brake Dimensioning Type 380.01 \_0 / Type 381. \_ \_ \_ / Type 3820.0 \_ \_

Diagram 1: Switching / Braking Times / Distances

## Name

1		Distance
2		Speed
3		Axial force
□	[°]	Angular position 0° (horizontal) to 90° (vertical)
a <sub>B</sub>	[m/s <sup>2</sup> ]	Acceleration of the downward-moving load, dependent on the angular position
a <sub>v</sub>	[m/s <sup>2</sup> ]	Retardation
g	[m/s <sup>2</sup> ]	Gravitational acceleration (9.81 m/s <sup>2</sup> )
F <sub>Br</sub>	[N]	Braking force for dynamic calculation
F <sub>erf.</sub>	[N]	Required holding force
F <sub>Nenn</sub>	[N]	Nominal holding force (minimum holding force)
F <sub>NGes</sub>	[N]	Total nominal holding force (one or more brakes)
F <sub>max</sub>	[N]	Maximum holding force
m	[kg]	Load mass
S <sub>Br</sub>	[m]	<b>Braking distance:</b> Distance from the beginning of the retardation up to the standstill of the load
S <sub>Sys</sub>	[m]	<b>System distance:</b> Distance travelled by the load until the retardation begins.
S <sub>Ko</sub>	[m]	<b>Stopping distance:</b> Distance from the signal interruption up to standstill of the load
t <sub>50</sub>	[s]	Brake switching time
t <sub>v</sub> <sup>1)</sup>	[s]	Valve switching time (not applicable for Type 3820)
t <sub>SV</sub>	[s]	Switching time control unit (signal processing time)
t <sub>Sys</sub>	[s]	System switching time
t <sub>Br</sub>	[s]	Brake braking time
t <sub>Ko</sub>	[s]	<b>Stopping time:</b> Time from the signal interruption up to standstill of the load
Q <sub>r</sub>	[J]	Friction work per braking action

## General

When selecting the brake, the nominal holding force must be greater or equal to the required holding force.

$$F_{Nenn} \geq F_{erf.} \quad [N]$$

## Dimensioning for dynamic braking (EMERGENCY STOP)

For safety reasons, at least the weight load of the masses to be held +100 % reserve must be provided.

The larger the ratio of the nominal holding force to the required holding force, the shorter the stopping distance (for the same technical conditions)

The minimum required holding force can be calculated with the following formula:

$$F_{erf.} = m \times g \times 2 \quad [N]$$

## Dimensioning for static holding (clamping)

For safety reasons, at least the weight load of the masses to be held +50 % reserve must be provided.

The minimum required holding force can be calculated with the following formula:

$$F_{erf.} = m \times g \times 1.5^{2)} \quad [N]$$

$$F_{erf.} = m \times g \times 1.25 \times \text{Inspection factor}^{3)} \quad [N]$$

The stopping distance / stopping time of the load to be braked is strongly dependent on the following influences:

- Switching time control unit (signal processing)
- Switching time of the control valve <sup>1)</sup>
- Switching time of the brake
- Cross-section and length of the lines

The larger the sum of the switching times, the later the retardation of the load occurs (due to longer periods of acceleration). The stopping distance / the stopping time becomes longer (with constant holding force).

**Please ensure sufficient dimensioning of the components of your system which may be placed under heavy loads during acceleration / retardation as a result of dynamic braking actions.**

## Name

Q <sub>r zul.</sub>	[J]	Permitted friction work per braking action
Q <sub>r ges.</sub>	[J]	Total friction work up to wear end (one or more brakes)
V <sub>0</sub>	[m/s]	Initial speed
V <sub>max</sub>	[m/s]	Maximum speed
Z <sub>zul.</sub>		Number of braking actions up to wear end

If you have any questions, please contact *mayr*® power transmission.

- 1) With the exception of Type 3820
- 2) Without cyclical brake test
- 3) Cyclical brake test with inspection factor. The inspection factor must be determined by the user with the applicable standards. 1.25 × inspection factor must result in at least 1.5. *mayr*® power transmission recommends ≥1.3 as inspection factor

## Calculation Example (Dynamic Braking)

Data:		
Angular position piston rod	$\beta$	= 90° (vertical axis)
Mass	m	= 800 kg
Initial speed	$V_0$	= 0.5 m/s
Valve switching time	$t_v$	= 0.016 s
Switching time control system	$t_{sv}$	= 0.020 s
Existing operating pressure		= 5 bar

### 1. Pre-selection of braking force

$$F_{\text{erf.}} = \frac{m \times g}{0.5} \quad [\text{N}]$$

$$F_{\text{erf.}} = \frac{800 \times 9.81}{0.5} = 15696 \quad [\text{N}]$$

Selected: ROBA®-linearstop Size 70, Type 381.12\_.\_  
Nominal holding force  $F_{\text{Nenn}} = 17500 \text{ N}$  at 5 bar operating pressure  
(from Table "Technical Data")

### 2. Calculation of the stopping distance /stopping time

Checking the selected brake size

#### Acceleration of the load

$$a_B = g \times \sin(\beta) = 9.81 \times \sin(90^\circ) = 9.81 \quad [\text{m/s}^2]$$

#### System distance

$$S_{\text{Sys}} = V_0 \times t_{\text{Sys}} + a_B \times t_{\text{Sys}}^2 \times 0.5 \quad [\text{m}]$$

$$S_{\text{Sys}} = 0.5 \times 0.096 + 9.81 \times 0.096^2 \times 0.5 = 0.093 \quad [\text{m}]$$

$$t_{\text{Sys}} = t_{s0} + t_v + t_{sv} = 0.060 + 0.016 + 0.02 = 0.096 \quad [\text{s}]$$

#### Braking distance

$$S_{\text{Br}} = \frac{V_{\text{max}}^2}{2 \times \left( \frac{F_{\text{NGes}}}{m} - a_B \right)} = \frac{1.44^2}{2 \times 12.065} = 0.086 \quad [\text{m}]$$

$$V_{\text{max}} = V_0 + a_B \times t_{\text{Sys}} = 0.5 + 9.81 \times 0.096 = 1.44 \quad [\text{m/s}]$$

### ROBA®-linearstop hydraulic

Switching time (Type 380.00_0) <sup>3)</sup>			Size			
			10	20	30	40
Brake switching time	$t_{s0}$	[s]	0.030	0.045	0.055	0.065

### ROBA®-linearstop pneumatic

Friction Work and Switching Times (Type 381.1_._) <sup>1) 3)</sup>			Size					
			20	30	40	60	70	80
Permitted total friction work up to wear end <sup>2)</sup>	$Q_{r \text{ ges.}}$	[10 <sup>6</sup> J]	0.36	0.75	1.14	3.6	5.85	10.35
Maximum permitted friction work per braking action <sup>2)</sup>	$Q_{r \text{ zul.}}$	[J]	579	1049	2097	7361	12948	24708
Brake switching time	$t_{s0}$	[s]	0.037	0.038	0.035	0.050	0.060	0.070

- 1) For friction work Type 381.0\_.\_, please contact mayr® power transmission. The switching times also apply for Type 381.0\_.\_.  
2) For higher friction work / total friction work, please contact mayr® power transmission.  
3) Switching times are influenced by line length, operating pressure and wear

### ROBA®-linearstop electromagnetic

Switching Times			Size					
			10	15	20	40	60	80
Type 3820.0_00_	$t_{s0}$	[s]	0.010	0.040	0.045	0.025	0.065	-
Type 3820.0_10_	$t_{s0}$	[s]	-	-	0.020	0.010	0.010	-

### Stopping distance

$$S_{\text{Ko}} = S_{\text{Br}} + S_{\text{Sys}} = 0.086 + 0.093 = 0.179 \quad [\text{m}]$$

### Stopping time

$$t_{\text{Ko}} = t_{\text{Br}} + t_{\text{Sys}} = 0.119 + 0.096 = 0.215 \quad [\text{s}]$$

$$t_{\text{Br}} = \frac{V_{\text{max}}}{\frac{F_{\text{NGes}}}{m} - a_B} = \frac{1.44}{\frac{17500}{800} - 9.81} = 0.119 \quad [\text{s}]$$

### Retardation (for system dimensioning)

$$a_v = \frac{F_{\text{NGes}} \times 2.5}{m} - g = \frac{17500 \times 2.5}{800} - 9.81 = 44.87 \quad [\text{m/s}^2]$$

$$\text{Load} = \frac{a_v}{g} = \frac{44.87}{9.81} = 4.57 \quad [\text{g}]$$

### 3. Friction work (Type 381.1\_.\_)

#### Friction work per braking action

$$Q_r = m \times a_B \times S_{\text{Br}} + 0.5 \times m \times V_{\text{max}}^2 \quad [\text{J}]$$

$$Q_r = 800 \times 9.81 \times 0.086 + 0.5 \times 800 \times 1.44^2 \quad [\text{J}]$$

$$Q_r = 1504 (< Q_{r \text{ zul}} = 12948) \quad [\text{J}]$$

#### Number of braking actions up to wear end

$$Z_{\text{zul.}} = \frac{Q_{r \text{ ges.}}}{Q_r}$$

$$Z_{\text{zul.}} = \frac{5.85 \times 10^6}{1504} = 3890 \text{ dynamic braking actions}$$
